

SPSA Reflection

Dzevad Lalicic

Overall, I really enjoyed this assignment because the sciences I'm learning/pursuing for a profession are very different to the sciences I wrote about in this class, and I liked it very much that I got to expand not only my knowledge on these topics but my eyes seeing the bigger picture in multiple sustainability topics. Me and my partner kept very good communication between us, while making sure no one was doing more work which was established on day one. However, I believe that we were much better at creating written pieces like our report, than creating a visualization of our piece such our presentation and the SPSA. Many skills including speaking publicly was a great addition to things I learned throughout this assignment, as well as expressing our message in many different models. Although on paper our topic was expressed profoundly, getting that message to our specific audience was a different experience for us since we had to express the same message while using 10% of the words and twice the amount of visual representations, when we're used to writing long essays and submitting them to be done with.

This conveys the importance of self-reflection by analyzing our own pieces and identifying ways we can improve. Although peer feedback is also essential for improvement, seeing what you can improve on yourself is more effective in enhancing our own work. This is a key role in avoiding any missteps in future projects, in order to determine any flaws in our work, and adding aspects to improve upon it.
